

Denk aan Kindcheck!

## Acute geïsoleerde paracetamolintoxicatie bij volwassenen

**Box 3: Dosering NAC** <sup>5,6</sup>

Start NAC binnen 8 uur na ingestie paracetamol: overlevingspercentage 100%. <sup>16</sup>

startdosis: 150 mg/kg, langzaam intraveneus toegediend in 60 min. (oplossing in 200 ml glucose 5% of natriumchloride 0,9%)

vervolgdosis: 75 mg/kg in 500 ml glucose 5% of natriumchloride 0,9% gedurende 4 uur.

Vervolgdosering voortzetten tot de plasma paracetamolspiegel kleiner is dan 5 mg/L, maar tenminste 24 uur.

\* ideaal gewicht

<sup>A</sup> indien aanwijzingen voor hepatotoxiciteit / ernstige intoxicatie (box 2): start NAC direct

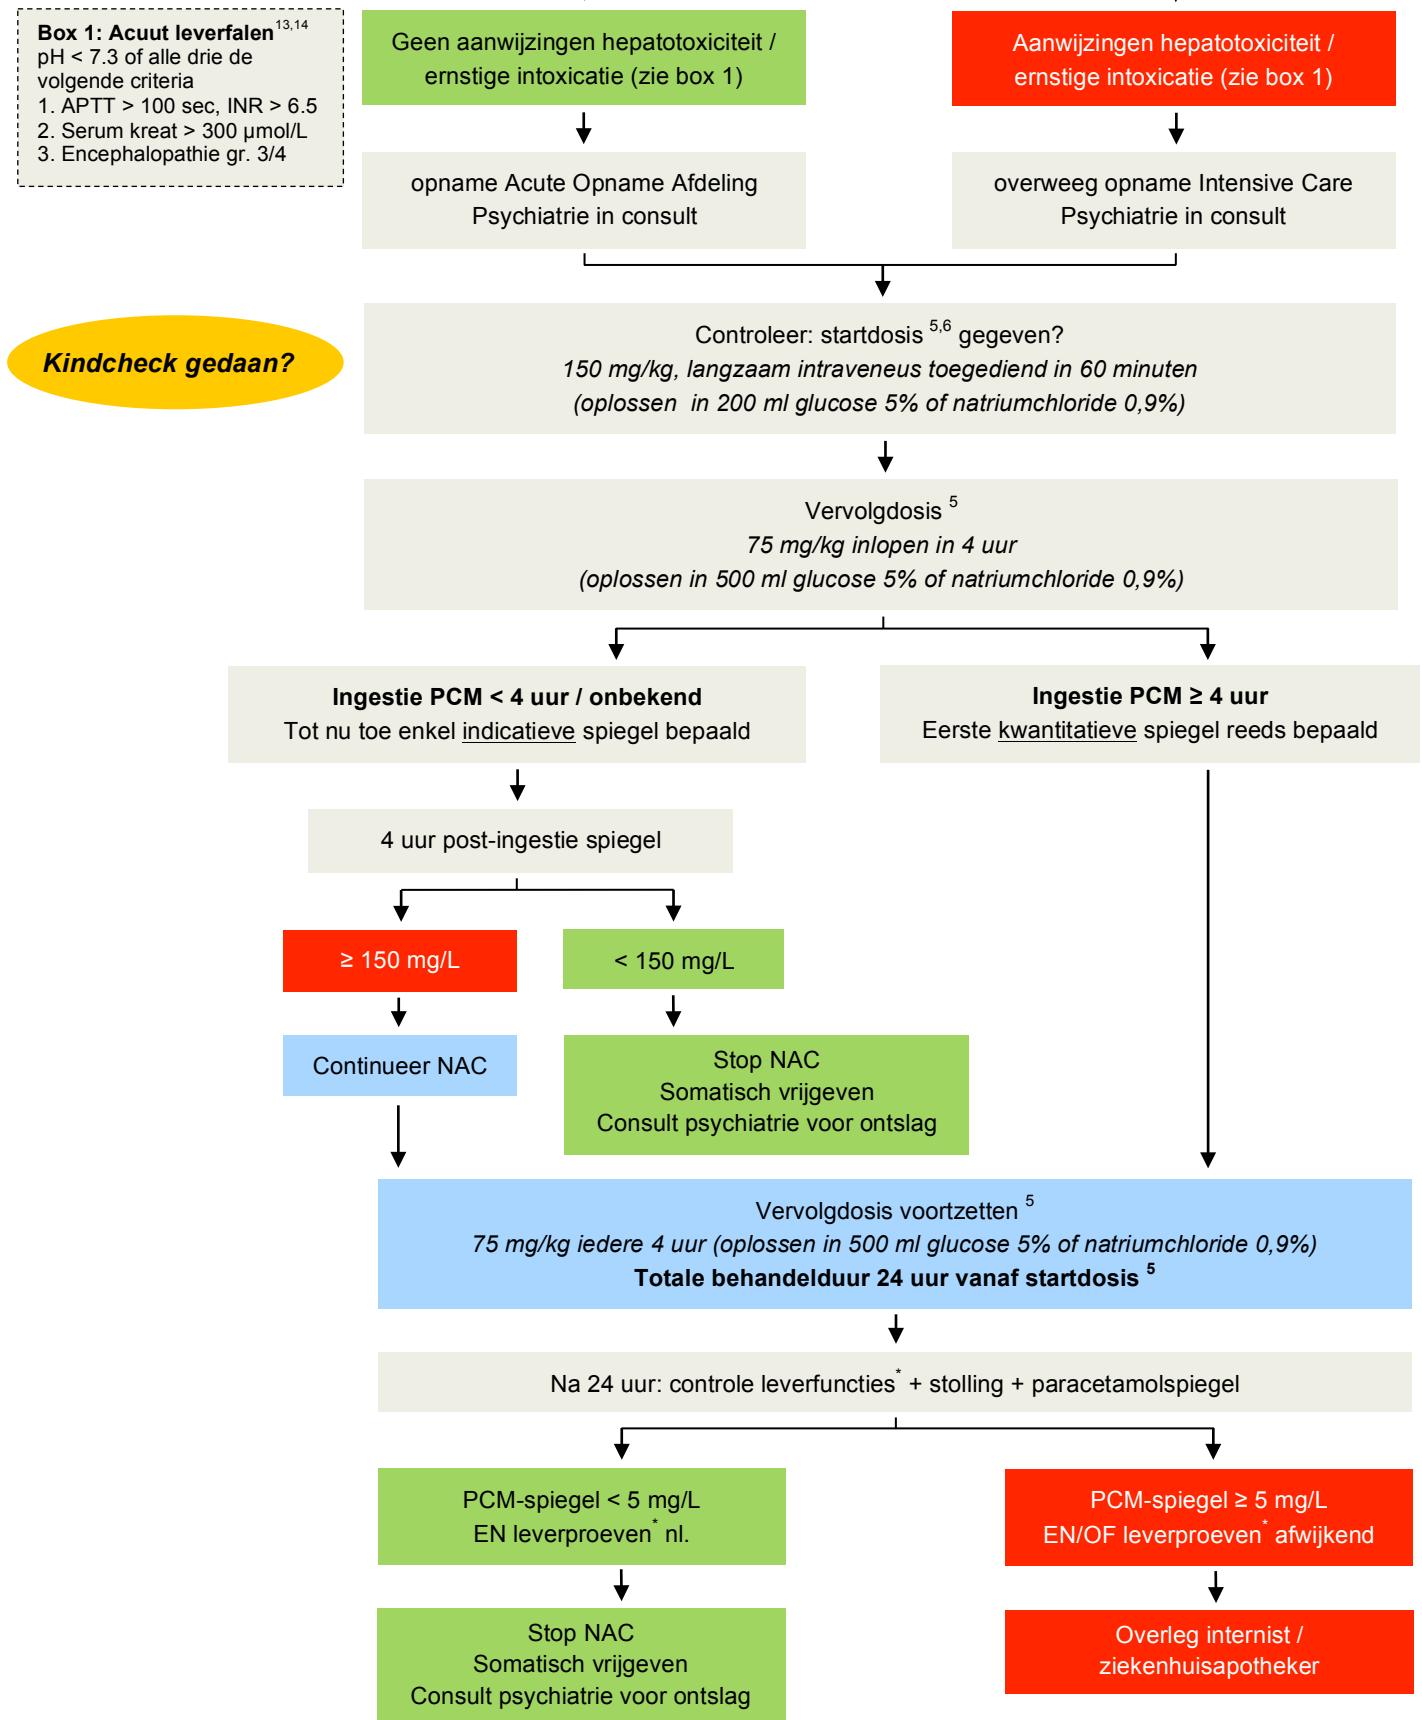

# enkel bij wakkere, coöperatieve patiënt. Dosering Norit: 50 gram, natriumsulfaat: 30 gram

<sup>+</sup> leverproeven: transaminasen, stolling

<sup>@</sup> of 4 uur na binnengang indien tijdstip onbekend

RR = bloeddruk; NAC = N-acetylcysteïne; PCM = paracetamol

## NAC gestart bij acute paracetamolintoxicatie

\* leverproeven: transaminasen, stolling

NAC = N-acetylcysteine; RRsys = systolische bloeddruk; PCM = paracetamol
